Creator	Tukey, John Wilder, 1915-
Title	John W. Tukey Papers
Date [inclusive]	1937-2000
Call number	Mss.Ms.Coll.117
Extent	169.5 Linear feet
Extent	169.5 linear feet
Location	LH-B-T1-1; LH-B-25-5 (OS)
Language	English
Abstract	<p>One of the most influential statisticians of the twentieth century, John Wilder Tukey (1915-2000) played a key role in both the development and study of statistics. Upon receiving his Ph.D. in mathematics in 1939 from Brown University, he joined the faculty at Princeton; in 1945, he also began work at Bell Laboratories. Equally committed to both Princeton and Bell Labs, Tukey chose to work concurrently at both institutions. He was also a consultant for many companies, such as Merck and Company, Xerox Corporation, and the Educational Testing Service, and was a frequent advisor to the government for such programs as the US Census. From 1960 to 1980 he led the statistical component of NBC's election night projections. Among other projects Tukey analyzed Alfred Kinsey's research and examined data on ozone depletion. Tukey made many important contributions to the field of statistics, such as work in time series analysis, exploratory data analysis, and multiple comparisons.</p>

Through his work, Tukey developed statistical applications including the Box-and-Whisker Plot, the Stem-and-Leaf Diagram, Cooley-Tukey Fast Fourier Transforms, Tukey's Paired Comparisons and citation and permuted indices. Tukey's influence extends beyond statistics to everyday language: he was the first to use the word "software" in print and coined words such as "bit" and "linear programming." A prolific writer, John W. Tukey penned more than 500 technical papers and reports and published, among numerous other works. His collected papers amount to eight volumes of work.

The Tukey Papers provides a comprehensive perspective into Tukey's professional activities from his days as a graduate student until his death in 2002. Among the material is his correspondence and his published and unpublished works. There is abundant material from Tukey's long careers at Bell Laboratories and Princeton University, including extensive lecture notes and syllabi. Also included are copious materials relating to his professional activities with such agencies as the National Research Council, the Army Records Office, Xerox PARC, Merck and Company, the President's Science Advisory Committee, and the National Academy of Sciences.

Background note

One of the most influential statisticians of the twentieth century, John Wilder Tukey (1915-2000) played a key role in both the development and study of statistics. Upon receiving his Ph.D. in mathematics in 1939 from Brown University, he joined the faculty at Princeton; in 1945, he also began work at Bell Laboratories. Equally committed to both Princeton and Bell Labs, Tukey chose to work concurrently at both institutions. He was also a consultant for many companies, such as Merck and Company, Xerox Corporation, and the Educational Testing Service, and was a frequent advisor to the government for such programs as the US Census. From 1960 to 1980 he led the statistical component of NBC's election night projections. Among other projects Tukey analyzed Alfred Kinsey's research and examined data on ozone depletion. Tukey made many important contributions to the field of statistics, such as work in time series analysis, exploratory data analysis, and multiple comparisons. Through his work, Tukey developed statistical applications including the Box-and-Whisker Plot, the Stem-and-Leaf Diagram, Cooley-Tukey Fast Fourier Transforms, Tukey's Paired Comparisons and citation and permuted indices. Tukey's influence extends beyond statistics to everyday language: he was the first to use the word "software" in print and coined words such as "bit" and "linear programming." A prolific writer, John W. Tukey penned more than 500 technical papers and reports and published, among numerous other works. His collected papers amount to eight volumes of work.

John Wilder Tukey was born on June 16, 1915 in New Bedford, Massachusetts. His father, Ralph H. Tukey, taught Latin at New Bedford High School. Barred by nepotism rules from teaching at the same school as her husband, Tukey's mother, Adah Tasker Tukey, became a private tutor. Her son showed intellectual promise early; soon, he became her primary pupil. The largely home-schooled John entered Brown University, graduating in 1936 with a degree in chemistry, earning a master's degree in chemistry in 1937. That year he entered Princeton intending to get a doctorate in chemistry but switched to mathematics (he had been studying both subjects), earning his doctorate in 1939. He published three papers before being awarded his doctorate, which itself in 1940 was published as *Convergence and Uniformity in Topology*.

Hired at Princeton as an instructor after receiving his doctorate, Tukey remained on the faculty throughout World War II. However, his talents for data analysis were recognized as being useful to the war effort. Thus, he joined the Fire Control Research Office, headquartered in Princeton. There, he worked on ballistics, range finding, and other fire control problems. Among his colleagues were Wilfrid Dixon, Merrill Flood, William Cochran, and Stanley Wilks. (Tukey also worked at the Princeton branch of the Frankfort Arsenal Fire Control Design Division.)

Soon after the war, Tukey was made associate professor of mathematics (Frederick Mosteller was his first doctoral student) and steadily rose through the academic ranks: professor of mathematics (1950-65); professor of statistics (1965-85), a department he helped found and served as chair until 1970; Donner Professor of Science (1976-85); Tukey moved to emeritus status in science and statistics in 1985, when he also became Senior Research Statistician. Tukey's amazing mathematical gifts were also put to use by Princeton's administration. From 1945-70 he was chair of the academic scheduling committee. While

lying on his back on a table, people would read to him the scheduling complexities. Tukey would solve the problems in his head and quickly call out solutions.

As an academic statistician Tukey made numerous contributions to his field. According to A. D. Gordon, as a practicing statistician, Tukey believed in:

*the usefulness and limitation of mathematical statistics; the importance of having methods of statistical analysis that are robust to violations of the assumptions underlying their use; the need to amass experience of the behaviour of specific methods of analysis in order to provide guidance on their use; the importance of allowing the possibility of data's influencing the choice of method by which they are analyzed; the need for statisticians to reject the role of 'guardian of proven truth', and to resist attempts to provide once-for-all solutions and tidy over-unifications of the subject; the iterative nature of data analysis; implications of the increasing power, availability and cheapness of computing facilities; the training of statisticians.*¹

One early and continuing interest was in time series analysis, the development of methods to analyze a sequence of data points, measured typically at successive times, spaced at (often uniform) time intervals. Bogert, Healey and Tukey developed cepstral analysis, for instance, to help distinguish an earthquake from an explosion, thus cepstral analysis has applications for the monitoring of nuclear testing.

Tukey explored the problem of robustness of data. For instance, a sample median is more robust than a sample mean, which can be thrown off by one large sample. Tukey recommended medians as a way of smoothing data, which is to capture important patterns in the data, while leaving out noise or other fine-scale phenomena. Smoothing data is very useful in image processing.

One would be hard pressed to find an area of statistics that Tukey did not work on and influence. Analysis of variance (ANOVA) and multiple comparisons were two other areas of interest.

The Fast Fourier Transform (FFT) is perhaps Tukey's most famous and useful contribution to statistics and their application. FFT, developed with James Cooley, is an algorithm that, as the name suggests, speeds data processing. A Discrete Fourier Transform (DFT) decomposes a sequence of values into components of different frequencies. Calculating DFT's is often too slow to be practical. Because the Cooley-Tukey algorithm breaks a particular DFT into smaller DFTs, it can be combined arbitrarily with any other algorithm for the DFT. An FFT (there are others besides Cooley-Tukey, which is the most common) can be applied in digital signal processing and for the quick multiplication of large integers and is a common technique useful in analyzing wave forms in such disciplines as astrophysics.

Tukey invented ways to display and to test datasets: stem-and-leaf diagrams, which substitute digits for frequency counts used in constructing histograms, allowing for quicker, more suggestive analysis; the box-and-whisker plot, a way of showing quartiles, extremes, and the median in one representation that can show the spread, skewness, and extremes of a dataset; and a paired comparison test, used to find which means are significantly different from one another by comparing all possible pairs of means and is called Tukey's HSD (Honestly Significant Difference) test.

Working at Bell Labs helped to support Tukey's academic work. Projects specifically at Bell Labs were often defense-related. One important project was the development of the Nike missile system; with B. D. Holbrook he did the aerodynamics, trajectory, and warhead designs. With Ralph Blackburn Tukey wrote two papers, published in the Bell System Technical Journal (1958), that introduced spectrum analysis to

engineering and scientific practice. Tukey left Bell in 1985, his final position being Associate Executive Director, Research and Information Services.

An active consultant for government and business, Tukey served on many committees and commissions and worked for a number of corporations. Whenever Tukey joined a committee or panel, he was invariably an active participant.

Among the corporations Tukey worked for were Merck (for over 40 years), and after his retirement, Xerox PARC. Most publicly, Tukey developed for the National Broadcasting System ways of projecting election results from partial counts. Tukey achieved some renown in 1960 when he prevented an early call of the election for Richard Nixon. Tukey remained with NBC until 1980, when refined exit polling replaced statistical analysis.

Public service occupied much of Tukey's career. He served as chairman of the Analytical Advisory Committee of the National Assessment of Educational Progress and its successor committee from 1963-1982. While on the President's Science Advisory Committee, he chaired the Panel on Chemicals and Health (1971-72) and the Panel on Environmental Pollution (1964-65) which issued the report, Restoring the Quality of Air. He was chairman of the National Research Council's Committee on Impacts of Stratospheric Change (1975-79) which issued three important reports on the deterioration of the ozone by fluorocarbons.

Another government agency for which Tukey consulted was the Census Bureau. On the politically-charged issue of using statistical adjustments to the census, Tukey favored using such methods because errors would be fewer than with individual enumeration.

National security matters were part of Tukey's career as well. In 1959 he was a delegate to Technical Working Group 2 of the Conference on the Discontinuance of Nuclear Weapons Tests, where his expertise in time series analysis was important in discussing monitoring tests. James Killian was appointed by Eisenhower to examine the nation's intelligence gathering ability and recommend ways it could be enhanced. Project 3 of Killian's Committee looked into the technology of intelligence gathering; Edwin Land chaired Project 3, whose members included Tukey. The U-2 spy plane came out of Project 3's recommendation to enhance intelligence gathering using the latest science and technology.

Two other important projects bear mentioning. Seeing a need for a comprehensive bibliography of the literature on statistics and probability, Tukey, enlisting the help of eminent colleagues, developed a citation index for the field. Another significant project was to review at the behest of the American Statistical Association the work of Alfred Kinsey (included on the review committee were Mosteller and Cochran). The statisticians and sex researchers did not get along well, Mrs. Kinsey wishing she could have poisoned them at a dinner at her house ("Tukey was the worst" she said) and Dr. Kinsey annoying Tukey by requesting he cease whistling Gilbert and Sullivan. The committee's report found statistical flaws in Kinsey's work, specifically problems with sampling methods and controlling randomness. Tukey stated that a random selection of three people would provide a better sample than three hundred chosen by Kinsey, who tended to select people known to each other.²

Tukey made many contributions to the development of computers and computing. His work with algorithms and robustness of data has software applications. Indeed, Tukey is credited with coining the work "software," which he first used in print in 1958, and "bit", short for "binary digit." The first

computer on Princeton's campus was probably an IBM 650 belonging to the Statistical Techniques Research Group.

Tukey was a member of many professional and scientific societies: Institute of Mathematical Statistics (president, 1960); American Statistical Association (vice-president, 1955-57); American Society for Quality Control; American Association for the Advancement of Science; Biometric Society (council member); National Academy of Sciences (council, 1969-72, 1975-78); American Academy of Arts and Sciences; The Royal Society, London (foreign member); Royal Statistical Society; and the American Philosophical Society (vice-president, 1975-77). He also served on Board of Fellows of Brown University (1974-88).

Many awards came to Tukey during his career: first recipient of the S. S. Wilks Award from the American Statistical Association (1965); Shewhart Medal (1977) and Deming Medal (1983) from the American Society of Quality Control; James Madison Medal (1984) from Princeton University; Educational Testing (ETS) Service Award for Distinguished Service to Measurement(1990); and in 1973, the National Medal of Science "for his studies in mathematical and theoretical statistics . . . and for his outstanding contributions to the applications of statistics to the physical, social, and engineering sciences."

Tukey married Elizabeth Rapp, who at the time worked at ETS, in 1950. They were married for 48 years, Elizabeth dying in 1998. They had no children. Outside his professional work, Tukey had a couple of passionate interests. One was folk dancing. Another was reading science fiction.

Scope & content

The Tukey Papers provides a comprehensive perspective into Tukey's professional activities from his days as a graduate student until his death in 2002. This collection consists largely of correspondence and unpublished and published works by Tukey, most notably *Exploratory Data Analysis*. There is abundant material from Tukey's long careers at ATT Bell Laboratories and Princeton University, including extensive lecture notes and syllabi. Also included are copious materials relating to his professional activities with such agencies as the National Research Council, the Army Records Office, Xerox PARC, Merck and Company, the President's Science Advisory Committee, and the National Academy of Sciences. Of particular interest is the collection of film that Tukey amassed while at Princeton during the late 1930s and early 1940s, which provides an unusual and wonderful glimpse into typical campus life for the young mathematician and his circle. Musicals, baseball practice, and lectures are but a few of the activities captured on film as well as illustrious individuals S. S. Wilks, Norbert Wiener, and Albert Einstein.

Series I. Correspondence

Collection Inventory

Series I. Correspondence
1938-2000**60 linear feet**

The correspondence of John W. Tukey is 34 linear feet and spans from 1938 through 2000. When possible, the arrangement of this material follows Tukey's original order therefore, correspondence can be found within other series as well. Broad in range, the material consists of everything from fellow Princeton mathematicians' collaborations in the 1930s to Tukey's quest for an especially favorite brand of canned mackerel. The majority of correspondence though reflects the many facets of Tukey's career as an renowned educator and statistician. Within this series are invitations to speak, project proposals, the exchanges of statistical information, and various stages of collaboration-related communication. Tukey maintained a businesslike tone even with individuals with whom he corresponded with for over sixty years. The correspondence from his mother, Adah, and wife, Elizabeth Rapp Tukey, however, are an exception. These warm and personal letters are few in number but lend insight into Tukey's marriage and family life.

The earliest correspondence in the collection is dated shortly after Tukey's arrival at Princeton University in 1937. Significant correspondents from Tukey's years at Princeton include Angus Taylor, Frank Smithies, Arthur Stone, John Nash, Ralph Philip Boas, Edward Canby, G. Baley Price, and Solomon Lefshetz. The correspondence illustrates Tukey's participation and at times creation of various organizations and clubs. The majority, however, appears to be to and from university friends discussing and working on various chemistry and mathematical matters. By all accounts, John W. Tukey was not an ebullient man, but despite his some what formal writing style, the correspondence reveals a level of warmth and camaraderie between Tukey and his colleagues.

Tukey began his appointment as Assistant Professor of Mathematics at Princeton in 1941 and joined the Fire Control Research Office shortly after. Related correspondents for this period includes organization director Merrill Meeks Flood and members Samuel Wilks and William Cochran. Most significant was Tukey's relationship with Harvard engineer Charles P. Winsor who, he declared, "converted me to statistics."

In early 1945, Tukey began working for Bell Labs, a lifelong association, as it would turn out. While at Bell Labs, Tukey worked with B. D. Holdbrook to develop the Nike missile system although the scant correspondence within this collection is rather routine and doesn't reflect their extensive contribution. Tukey also had a reputation for being discreet regarding his more sensitive projects.

Series I. Correspondence

There are many letters from Tukey's students who continued to seek his counsel long after they left the classroom. Among those he worked with over the years (in chronological order) are: Frederick Mosteller, Leo Goodman, Paul Meier, David Brillinger, Richard Link, Arthur Dempster, David Brillinger, John Hartigan, Peter Nemenyi, W. Morven Gentleman, David Hoaglin, Anita Parunak, Paul Velleman, Karen Kafadar, Paul Horn, Stephen Morgenthaler, Clifford Hurvich, and George Easton. Tukey not only offered advice and support but went on to collaborate with former students as an advisor, editor, and co-author of numerous books and papers.

Finally, there is material from various organizations within which Tukey actively participated or consulted: American Statistical Association, Institute of Mathematical Statistics, National Academy of Sciences, National Assessment of Educational Progress, National Research Council, National Science Foundation, Office of Naval research, Xerox PARC, and the Hoover Commission.

Series II. Works By Tukey

Series II. Works By Tukey**1938-1994****25 linear feet**

The Works by Tukey Series is 15 linear feet organized in two sub-series: Papers and Talks, both of which are organized alphabetically by title. The Papers sub-series is 14 linear feet; the Talks, is one linear foot. John W. Tukey was a prolific writer and an extremely active speaker throughout his long career. In all, Tukey wrote more than 500 technical papers and reports which ultimately filled more than eight volumes of collected works.

Subseries A. Papers**14 linear feet**

Tukey's earliest papers coincide with his arrival at Princeton in 1937. Early papers consisted mostly of notes compiled from lectures he'd attended although most are complete papers. Several of the existing early papers include: *On the Distribution of the Fractional Part of a Statistical Variable* (1938); *A Note on Linear Functionals and Correction to "A Note on Linear Functionals"* (1938) with Ralph P. Boas; *The Intrinsic Metric of a Polytope* (1939); and *Compactness in General Spaces* (1940).

Although Tukey arrived at Princeton armed with both undergraduate and graduate chemistry degrees from Brown, he eagerly pursued mathematics degrees. His interest in statistics grew organically out of the military research work he conducted in the early 1940s, reinforced with an association with Charles P. Winsor whom Tukey admired and respected very much. Tukey's work from 1940-1960 reflects the interest in statistical theory and applications and other topics such as partition models and non-parametric estimation, including confidence intervals for prediction. There are also various papers on distribution theory, and a paper on transformations.

Tukey's work on sampling theories, analysis of variance, and time series was a natural progression from his pursuit of statistical theory. Papers concerning these topics are well-represented topics within the Works Series. Tukey wrote on sampling theory throughout his long career; the earliest paper within the collection is *The Sampling Theory of Power Spectrum Estimates* (1949) to a collaboration penned in 1990 with Paul Tukey, *Studentized Range with Covariance: Experimental Sampling and Monte Carlo*. Tukey's earliest analysis of variance work are his two 1949 papers *Comparing Individual Means in the Analysis of Variance and Dyadic Anova*, *An Analysis of Variance for Vectors* and his latest was written in 1998 with Allan Seheult: *Towards Robust Analysis of Variance I*.

Time series work within the series includes *What Does the Mean-Square-Successive-Difference Measure When Applied to Time Series?* (1950); *The Spectral Representation and Transformation Properties with High Moments of Stationary Time Series* (1953); *Time Series Analysis (Not*

Subseries A. Papers

Analysis) written with Bruce P. Bogert and M. J. R. Healy in 1962 and *Can We Predict Where "Time Series" Should Go Next?* (1978). There are several undated papers on time series with the Works Series as well.

Tukey wrote on the topic of multiple comparisons for years; about half of his papers within this collection are collaborations. Multiple comparisons works written solely by Tukey include two folders labeled *Multiple Comparisons* (n.d.) containing 22 items; *The Problem of Multiple Comparison* (1973); and *Some Thoughts on Multiple Comparisons* (1992). Multiple comparison collaborations include: *Short-Cut Multiple Comparisons for Balanced, Single and Double Classifications: Part 1, Results* and *Short-Cut Multiple Comparisons for Balanced, Single and Double Classifications: Part 2. Derivations and Approximations* with T. E. Kurtz, R. F. Link, and D. L. Wallace; and *Controlling Error in Multiple Comparisons, with Special Attention to the National Assessment of Educational Progress* with Lyle Jones and Valerie S.L. Williams.

"Data analysis," Tukey's method for studying experimental results, was an important contribution to the field and can be credited with changing the standard and language of statistics. Tukey acknowledged two types of data analysis: exploratory data analysis and confirmatory data analysis. There are over a dozen papers within the collection on Exploratory Data Analysis between 1970 and 1994. (Several papers are undated and therefore could have been written before or after the recorded dates.) The earliest exploratory data analysis titles are *Exploratory Data Analysis for Physicists* and a folder containing 22 items labeled *Comments on Exploratory Data Analysis*. Later papers on exploratory data analysis include: *Exploratory Data Analysis, 1991-1994* (1993) and *Exploratory Data Analysis, 1995-2005*. There are two confirmatory data analysis papers within the Series: *We Need both Exploratory and Confirmatory* and *Some Illustrations of Confirmatory Analysis*. Analysis of variance (ANOVA) and regression are the guiding principles behind statistics and Tukey made many important contributions to each of them. ANOVA papers include: *Dyadic Anova, An Analysis of Variance for Vectors* (1949), *How to Look at ANOVA AND What it Can Do* (1988) and *Some Set-Ups for ANOVA-Like Inference* (1990). There are papers on many other topics within the Works by Tukey Series; the mentioned titles are representative of just a small sample of relevant topics.

Subseries B. Talks

Subseries B. Talks

1 linear foot

Tukey was not only a highly productive writer but was also an active speaker. Included within the Talks sub-series are interviews, conference lectures and paper presentations, and panel discussions. Some of Tukey's lectures, such as *Statistician's and Today's Conflicts*, were later published as papers and can be found in Tukey's *Collected Works*. On a few occasions Tukey was asked to testify before the U.S. House of representatives and the U.S. Senate regarding issues such as the census and the environment. Transcripts of his testimony including his statement as a Member of U.S. Delegation to Technical Working Group Two, Geneva Test Ban Conference are included in this sub-series. Of special note is an interview with Tukey and Albert Tucker which details Tukey's thoughts on the Princeton mathematics community in the 1930s.

XXNN, an Unexploited Opportunity

Series III. Works By Others

Series III. Works By Others

1937-2000

3 linear feet

The Works by Others Series is three linear feet arranged alphabetically by Author's last name. Order was imposed as the material arrived disorganized and Tukey's intended method for keeping the materials wasn't apparent. Within this series are papers by colleagues and collaborators, some former students. The material within this series reflects Tukey's role as constructive critic and contributor to those who sought his opinion on statistical and mathematical matters.

The retention criteria for material within this series is limited to work with which Tukey directly contributed or influenced. We retained some material, however, because it is commentary on work by Tukey himself. The following are examples of material that falls into this category: by E. Kaplan, *Comments on Tukey's Multiple Comparisons*; by Harold W. Kuhn, *Notes of a Problem by Tukey*; by Howard Wainer, *Graphical Visions from William Playfair to John Tukey*.

Anderson, John Lynde and George Wesley Spangler Serial Statistics: Is Radioactive Decay Random?	1973	14 items	Box 1
Anderson, T.W Some Scaling Models and Estimation Procedures in the Latent Class Model	n.d.	1 item	Box 1
Andrews, David F. and Daryl Pregibon Finding the Outliers that Matter	1977 March	1 item	Box 1
Andrews, David F Some Monte Carlo Results on Robust/ Resistant Regression	1973	12 items	Box 1
Anscombe, Francis John Looking at Two-way Tables	1982	3 items	Box 1
Anscombe, Francis John Transformation of Poisson, Binomial and Negative-Binomial Data	n.d.	1 item	Box 1
Arvesen, James N. and David S. Salsburg	1971	5 items	Box 1

Series IV. Princeton University

Series IV. Princeton University	1937-1987	21 linear feet
<p>Much of the early material in the Princeton University series concerns the Fire Control Research Office, formed during World War II to aid the war effort, a group Tukey enthusiastically participated in. Later material is directly related to Tukey's duties as a professor and department head. There are many folders concerning the mathematics and statistics courses he taught over the years and also much material generated by the Statistical Techniques Research Group. There is general faculty-related correspondence as well as a number of folders concerning the Citation Index.</p>

Series V. Bell Laboratories

Series V. Bell Laboratories	1946-1985	7.5 linear feet
<p>This series contains material from John W. Tukey's career at Bell Laboratories, one spanning 40 years. Most of the material research and development projects at Bell Labs as well as memoranda concerning managerial issues. Among the material is a Management Attitude Survey Tukey participated in for a number of years beginning in 1940 and ending in 1957. There is substantial material concerning a lawsuit brought by the states of New Jersey and Indiana in which Tukey testified on rate determination. There is general correspondence as well as documentation of other projects and committees Tukey worked on while employed by Bell Labs, such as The President's Science Advisory Committee and a number of folders with material about pollution. There are a number of appointment records and secretary's records of correspondence books.</p>

Series VI. Organizations

Series VI. Organizations**1947-1995****18 linear feet**

The first box of the series contains various organizations' correspondence, arranged alphabetically; the boxes following general correspondence cover the organizations with which Tukey was associated.

American Statistical Association, 1951-1987

Army Research Office, 1956-1995

Brown University, 1950-1989

Central Intelligence Agency, 1952-1988

CIBA-GEIGY Corp., 1976-1985

Exxon, 1977-1984

The Health Effects Institute, 1981-1995

Institute for Defense Analysis, 1954-1994

Merck, 1974-1997

National Academy of Science, 1954-1991

National Assessment of Educational Progress, 1966-1996

National Research Council, 1951-1982

National Science Foundation, 1952-1990

President's Commission on Federal Statistics, 1966-1979

President's Science Advisory Committee, 1957-1992

Series VI. Organizations

(Rand) Research and Development, 1945-1992

Society for Industry and Applied Mathematics (SIAM), 1954-1993

Xerox PARC, 1972-1992

Series VII. Personal

Series VII. Personal**1937-1999****4 linear feet**

Consists of personal correspondence and family photos, boxes of index cards, appointment books, and awards, medals, I.D. cards and dozens of tiny address books. Also included: doctoral research (1937), a 1957 diary, and "message books," (1980-1992). Also in the series is material on folk dancing, post cards, news clippings and assorted family photos of Tukey's wife, Elizabeth, and his parents, Ralph and Ada Tukey.

Series VIII. Printed Materials

Series VIII. Printed Materials

1942-1991

4 linear feet

Consists mostly of industrial and military books, pamphlets, and reports, reprints and publications from the American Statistical Association, National Science Foundation, and National Academy of Sciences. Also included are books and pamphlets on folk dancing.

Series IX. Graphics**Series IX. Graphics****1930's-1990's****6 linear feet**

The Graphics series, arranged alphabetically, is a mixture of computer discs, audio and visual tapes, and photographs.

Included in the series is one linear feet of stray floppy discs (1987-1990) and 21 data cartridge tapes, (1988-1989); and a box of 11 discs labeled, PIMI PIMA.Doc (6/2/1994). Other items include 4 large tapes containing "Uncropped Bell Labs Frequency data" (7 Jan. 1971) and 3 tapes labeled, "Att. Management Survey (n.d.)." Also included is a series of Tukey portraits taken over the years, an IBM workshop shot (1948); photos of the Geneva Arms Control Talks, (1959); casual photos taken at the Center for Advanced Study in the Behavioral Sciences, (1957-1958); photos taken during NBC's Operation Ballot, (1968); group photos of the President's Science Advisory Committee, (1959-[1963]). Photos of Tukey's Princeton colleagues, the Mathematics Department Princeton, and some photos of Tukey lecturing are included among the professional graphics. The Bell Laboratory photos contain group shots of Tukey and colleagues. Also included is a collection of VHS video tapes of consensus material and an interview with John Tukey. Most of Tukey's personal snapshots of Princeton and elsewhere have been digitized.

Among the video tapes is a John Tukey Educational Testing Services seminar, (1990-1996). There are a number of thumbnail photos of Tukey's early days at Princeton University featuring photos of Tukey's Princeton friends and colleagues, classroom scenes, and social gatherings; a 14-tape (Beta format) collection of the first American Statistical Association First Annual Statistical Short Course (1975); and 7 tapes containing Citation Index material (n.d.).

One linear feet of cassette tapes contains lectures such as "The Analysis of Data—Exploration as one Road to Discovery" (May 15, 1975; UC Berkeley); "An Unexplored Opportunity," Prof. John W. Tukey, meeting of the Classification Society of North America, St. John's Newfoundland, 13 July 1985; and 14 cassettes of Princeton Robustness Week (1981).

The personal material contains 6 boxes of personal slides, mostly travel and vacation shots, reel-to-reel tapes and photos of friends and colleagues. The photos (19927-1990) include a birding expedition, camping trips and travel, weddings, and other family gatherings.

Series X. Research

Series X. Research**1944-1988****6 linear feet**

The Research series is arranged alphabetically according to project/paper title. Occasionally the folder title is a rough draft of a paper found in Series II, Works by Tukey. Much of the material in the series is undated. The earliest material appears to be a folder of "Blotto Problem" material, (1948). There is much material on analysis of variance (ANOVA) as well as folders of material Tukey called "Badman," and "Nachless," both largely undated. Also included is miscellaneous correspondence, material concerning cancer rates, Exploratory Data Analysis, and material relating to graphs and graphing. There is much exploratory data analysis material and many folders of miscellaneous research material, 1940-1965 and undated research. Included in the series is Nike missile data (1946, 1952); noise data (1984); Phipps-Cochrane material (1947-1948); "Re-expression" material; undated material on "time series;" tuberculosis data; and weather-rainfall data.

Series XI. Subject Files

Series XI. Subject Files

1946-1997

5 linear feet

The Subject Files is arranged alphabetically according to subject.

Arms Control, 1949-1995

Census, 1963-1992

Elections, 1948-1980

Environment, 1945-1993

Early computers, 1936-1957

Flexagons, 1949-1977

Kinsey materials, 1929-1952

National Defense, 1957-1967

Race-Bias Case, 1996-1997

Security Clearances, 1950-1990

Wilks, Samuel, 1964
