## Summary Information

---

<b>Repository</b>	American Philosophical Society
<b>Creator</b>	Wright, Sewall, 1889-1988
<b>Title</b>	Sewall Wright Papers
<b>Date [inclusive]</b>	1885-1988
<b>Call number</b>	Mss.Ms.Coll.60
<b>Extent</b>	17.0 Linear feet
<b>Location</b>	LH-SB-2-3
<b>Language</b>	English
<b>Abstract</b>	Sewall Wright ranks among the most influential figures in the field of population genetics during the 20th century, and made important contributions to biostatistics, biometrics, and evolutionary theory. These papers contain much of Wright's professional correspondence, scattered research notes, and drafts of a small number of papers.
<b>Preferred Citation</b>	Cite as: Sewall Wright Papers, American Philosophical Society.

## Background note

---

One of the pioneers of quantitative genetics and evolutionary biology, Sewall Wright was born in Melrose, Massachusetts, to Philip Green Wright and Elizabeth Quincy Sewall Wright on December 21, 1889. He was, as he was fond of noting, the child of two cousins - the result of inbreeding. From early in his career, Wright contributed to emerging understandings of Darwinian natural selection and Mendelian genetics to lay the groundwork for modern population genetics and the Neo-Darwinian "modern synthesis." He made profound theoretical contributions in the theories of genetic drift and shifting balance, and was equally important in analyzing problems in the relationship of genotype and phenotype, biometrics, and biostatistics.

The hallmark of Wright's scientific work was his ability to combine experimental and theoretical approaches, and to apply novel mathematical and statistical methods to analyze problems in biology. Many of his theoretical insights took years to prove empirically, and others were so computationally intensive that they could not easily be tackled in the pre-computer era, but his influence, along with that of his friend, J.B.S. Haldane, and some-time antagonist, R. A. Fisher, helped reorient the disciplines of evolutionary biology and genetics along more rigorous, quantitative lines.

Wright's professional education began at Lombard College (BS, 1911), now defunct, and the University of Illinois (MS, 1912), from which he gained admission to Harvard. Opting to work on guinea pigs, one of the first groups of animals to be thoroughly studied by geneticists, Wright received his doctorate of science in 1915 for the lucidly-titled dissertation, *An Intensive Study of the Inheritance of Color and of Other Coat Characteristics in Guinea Pigs*. His choice of topic proved particularly fruitful in landing his first professional position, as Senior Animal Husbandman with the U.S. Department of Agriculture.

The U.S.D.A. was interested in having the brilliant young geneticist begin to analyze the extensive set of trait records they had gathered for their inbred guinea pig colonies established in 1906, all in the hope of applying the findings to improve livestock breeding. To make the connections between guinea pigs and swine, Wright felt it necessary first to develop a general theory of population genetics, which in turn, he argued, required more powerful and flexible statistical techniques than had previously been used. By 1918, Wright had worked out a new statistical approach, path analysis, which now has wide application in sociology, econometrics, and behavioral genetics, and with this new tool, began investigating some fundamental questions in inheritance and population genetics, delving into the relative influence of heredity and the environment in determining the appearance of traits.

By the early 1920s, Wright's methodological and theoretical approaches had matured, and he later believed that by the time he left the U.S.D.A. for the University of Chicago in 1926, he had developed most of his fundamental ideas about evolutionary processes. His first theoretical paper, the influential "Evolution in Mendelian populations," was written in 1925, though not published until 1931. Among the most controversial and far-reaching of his ideas was the theory of genetic drift, which was as widely misunderstood and misrepresented, according to Wright, as it was widely known, and which was the crux of a long-standing argument in the literature with R.A. Fisher, among others. Based on his findings, Wright suggested that small, random genetic changes ("drift") in small local populations can greatly increase the "field of variability" available for natural selection. The implications for understanding the

speciation process and the rates and trajectories of evolutionary change were profound, and although controversial, his theory had a galvanizing influence on evolutionary studies, expanding the range of potential evolutionary mechanisms and invigorating debate over evolutionary mechanics. Although Wright is often said to have presented a "non-Darwinian" model for evolutionary change, he later insisted that what he had provided was instead a means of producing variability upon which the powerful forces of Darwinian natural selection could operate.

At the U.S.D.A. and at the University of Chicago, Wright also began to develop a view of evolution as consisting largely of "occasional shifts" from one state of genetic near equilibrium to another, rather than the progressivist paradigm that had dominated evolutionary studies (maintaining that evolution proceeded by the slow, incremental accumulation of small mutations and concentrating on the fixation of discrete characters). Perhaps more subtly, Wright also insisted upon focussing upon the evolution of "interaction systems" as opposed to isolated traits or organisms in isolation of their populations, laying the groundwork for understanding the evolutionary process as occurring at more than one hierarchically related levels. "An organism," he wrote, "is not a mere aggregation of characters, but a harmonious, tightly integrated entity," implying that this integration was as true at the level of the population as the gene. It would not be overstatement to suggest that Wright's theoretical, statistical, and empirical studies, in interaction with the work of Fisher, Haldane, George Gaylord Simpson, and others, were instrumental in fashioning the Neo-Darwinian synthesis of the 1940s, representing the firm fusion of Mendelian and Darwinian principles, and in galvanizing the macroevolutionary studies of the 1970s and 1980s.

At Chicago, Wright was employed (successively) as Associate Professor of Zoology, Professor, and the Ernest D. Burton Distinguished Service Professor, earning a reputation as a conscientious, demanding, and engaging teacher, who always incorporated the latest available information in his lectures. He also spent visiting years as Hitchcock Professor at the University of California Berkeley (1943) and as Fulbright Professor at the University of Edinburgh (1949-1950).

In 1955, Wright joined the faculty of the University of Wisconsin as Leon J. Cole Professor of Genetics, and worked for five years until his "retirement" in 1960. For Wright, though, retirement did not mean a slacking off of research. Virtually until the day of his death at age 98, Wright remained an active participant in the Genetics Department at Wisconsin as Professor Emeritus. Many of the 210 scientific papers he wrote during his career were published after his departure from Chicago -- literally up until the time of his death -- and his magnum opus, the four volume *Evolution and the Genetics of Populations* (Chicago, 1968-1978), was completed only months before his 90th birthday.

Wright's professional associations were numerous, as were the laurels of his innovative and influential scientific career. He was awarded ten honorary doctorates during his lifetime, was president of five scientific organizations and the recipient of nine medals or prizes, and he held memberships in thirteen scientific societies or national and international organizations. In 1932, he was elected to membership in the American Philosophical Society.

Wright married Louise Lane Williams in 1921, with whom he had three children, Richard, Robert, and Elizabeth Quincy Wright Rose. Louise Wright died in 1975, followed by Sewall on March 3, 1988, in Madison.

---

## Scope & content

---

The Sewall Wright Papers document the thought and professional activities of one of the 20th century's greatest quantitative evolutionary biologists. Containing Wright's professional correspondence, scattered research notes, and drafts of a small number of papers

---

Series I.	Correspondence, 1931-1991	27 boxes, 13.5 linear feet
Series II.	Manuscripts	2 boxes, 1 linear foot
Series IIa.	Research data and notes	2 boxes, 1 linear foot
Series III.	Biographical and autobiographical material	0.5 boxes, 0.25 linear feet
Series IIIa.	Transcripts of oral history interviews	1.5 boxes, 0.75 linear feet
Series IV.	Photographs	1 box, 0.5 linear feet

## Administrative Information

---

### Publication Information

American Philosophical Society 8/2001

## Provenance

---

### Acquisition Information

The Wright Papers were initially collected and organized by William Provine for his book, *Sewall Wright and Evolutionary Biology* (University of Chicago, 1978), and donated by him to the APS Library in 1988.

Provine had arranged Wright's papers largely by subject, however at the APS the correspondence has been reorganized by correspondent. Records of Provine's arrangement are available.

## Related Materials

---

### Related Material

The APS collections include the papers of a number of Wright's contemporaries in genetics and evolutionary biology, notably [Theodosius Dobzhansky \(B D65\)](#), , [Herbert Spencer Jennings \(B J44\)](#), , and [George Gaylord Simpson \(Ms. Coll. 31\)](#).

He appears as a correspondent in several other collections, including [A. F. Blakeslee \(B B585\)](#), , [Charles B. Davenport \(B D27\)](#), , [Milan Demerec \(B D394\)](#), , [L. C. Dunn \(B D917\)](#), , [Hubert Dana Goodale \(B G61\)](#), , [Michael Lerner \(B L563\)](#), , [C.C. Li \(Ms. Coll. 127\)](#), , [Jack Schultz \(Ms. Coll. 27\)](#), , [Curt Stern \(Ms. Coll. 5\)](#), , and [Ann Roe \(B R621\)](#).

### Separated Material

Tape recordings of oral history interviews conducted by William Provine have been transferred to the APS recordings collections.

## Collection Inventory

## Series I. Correspondence

1895-1988

13.5 Linear  
feet

Incoming and outgoing professional correspondence, with a lesser quantity of administrative and personal correspondence.

The bulk of Wright's professional correspondence concerns discussions, elaborations, or clarifications of his ideas with respect to those of other scientists, or commentary on papers submitted for publication. Wright frequently served as a referee or commentator for professional journals. Among the more interesting correspondence are letters concerned with the social implications of genetic theories and discussions of the relationship of science and politics.

Correspondence relating to Wright's administrative responsibilities date mostly from his years at the University of Chicago, or relate to his work with professional societies. The majority consists of recommendations, elections, candidates for positions or offices, and the definition of institutional goals and agendas. There is also some correspondence relating to honors and awards received by Wright. Finally, a relatively small number of items are concerned with Wright's philosophical views.

In general, correspondence is filed alphabetically by author, then chronologically by date written. In instances in which letters were written on behalf of an institution, they are filed under the name of the institution rather than the author, per se.

## Series II. Manuscripts

## Series II. Manuscripts

1.0 Linear  
feet

Typewritten, handwritten, and published copies of papers written by Wright, submitted to him for review or comment, or garnered by him in the course of his research. The manuscripts are almost exclusively concerned with Wright's scientific interests, but also include some papers relating to his teaching.

Manuscripts are arranged by author, title, and year of publication, in that order.

<b>Dobzhansky, Theodosius Grigorievich, 1900-1975</b>	1948	28.0 p.	Box Series II-1
Genetics of natural populations. XVIII experiments on chromosomes of <i>Drosophila pseudoobscura</i> from different geographic regions			
<b>Dubin, Nikolai Petrovich, 1907-1998</b>	n.d.	4.0 p.	Box Series II-1
Work of Soviet biologists: theoretical genetics			
<b>Frankham.</b>	n.d.		Box Series II-1
Two confused coefficients of relationship: coefficient of relationship and coefficient of genetic similarity II			
<b>Hedrick, Philip W.</b>	1979		Box Series II-1
The establishment of chromosomal variance

## Series Ila. Research data and notes

Series Ila. Research data and notes	1928-1973	1.0 Linear feet	Box Series Ila-1-2
-------------------------------------	-----------	-----------------	--------------------

Hand-written notes recording experimental results and statistics, compiled by Wright or others, or the analysis of primary data. In some cases, these notes relate to Wright's efforts to verify; presumably, some computations are applications of Wright's "path analysis," and others relate to his work as referee of other people's papers.

Manuscripts are arranged by author, title, and year of publication, in that order.
